

Undergraduate Grade Calculation

(a) Grade evaluation

As a rule, grade evaluation consists of assessment based on a raw score of 60 points or higher out of 100 points possible in the combined total of examinations, regular grades, and attendance as the passing mark, or based on a letter grade (S, A, B, C, or D, with D constituting a failing grade). Courses that have been passed are indicated on report cards/transcripts as indicated below.

The letter grades and the corresponding point ranges and evaluation criteria are as follows.

S (90 points or higher): Fully achieves the basic goals and produces results that are highly excellent.

A (80 to 89 points): Fully achieves the basic goals.

B (70 to 79 points): Achieves the basic goals.

C (60 to 69 points): Achieves the basic goals at the minimum level.

D (Under 60 points: failing grade): Does not achieve the basic goals. Must be retaken.

In addition to the preceding criteria, evaluation criteria have been set with a guideline of limiting S grades to 15% or less of the total number of students evaluated (2 students or less if the total is less than 10). If an assessment cannot be made because the student has discontinued the course, a failing grade of D will be given. Some courses utilize a raw score calculation and others utilize letter grades. Grades are determined as follows in the case of the latter.

$$S = 95, A = 85, B = 75, C = 65, D \text{ (failing grade)} = 55$$

(b) GPA system

To promote educational reform from the standpoint of the student, the University has adopted the grade point average (GPA) system, as has been done in the U.S. and the various countries of Asia. Under this system, the student's grades for each course are converted to grade points (GP) through a fixed method, then the GP is multiplied by the number of credits for the course. The total for all courses is calculated, then that value is divided by the total number of credits for the courses in which the student was enrolled.

The GPA system guarantees not only the "amount" of learning as indicated by the number of credits, but also the "quality" based on the student's grades. The GPA is intended to make the results of learning each semester clearer, as well as to make the improvement in the student's motivation to learn, her self-control in course registration, and the goals of her efforts more concrete. There are three aims and effects that are considered to be important to students.

1) Further increase the motivation to learn.

It becomes easier to reflect the effort to improve learning of individual subjects in grades. In the past, grade evaluation consisted only of a 5-level scale, and because it was a rough assessment, it was difficult to reflect the amount of effort in grades.

Under the GPA system, the raw scores of course tests and reports are actually reflected in the grade, so it is easier to get a clear view of the difference in effort to learn, from the difference in grades. Accordingly, students are likely to be more motivated to improve their own performance, and participate actively in class.

In addition, students are able to get a sense not only of the credits that they earn, but also of the meaning of getting better grades.

2) Avoid failing and learn thoroughly.

If a student fails a course, the GP used in GPA calculation is 0, and the number of credits for that course is added to the denominator in that calculation. Because of that, failing a course does significant damage to the student's final GPA.

This means that there will be no more situations in which failed courses are excluded from transcripts and students avoid any loss as long as the course was not a required course. However, if a student retakes and passes a course she had previously failed, the previous grade is replaced by the new grade, and the GPA is recalculated.

In any event, it is important to be sure to avoid failing courses under the GPA system. Accordingly, it is important to avoid taking more courses than necessary and creating an excessive burden, but rather to take courses in a planned and orderly fashion.

3) Understand the positioning of her own performance and increase the transparency of each type of screening criteria.

Students can check their GP for courses each semester as well as their GPA, and see the position of their performance relative to other students at the University. Further, in the future, students' GPAs will be used in things such as the criteria for awarding scholarships, prerequisites for certain courses, and benchmark indices for a variety of screenings within the University, so it will be easier for students to set concrete goals related to the grades they should aim for.

In addition, it will make it possible to respond when the student's GPA is requested for employment, overseas study, advancement to higher degree programs, and other things outside the University.

(c) GPA calculation method

The GPA is obtained by converting the grade for each course (the raw score SS, out of 100 possible points) to GP using the calculation method indicated in 1), then multiplying the GP by the number of credits for the applicable course using the calculation method indicated in 2). The combined total of the resulting values for all courses taken is then calculated and divided by the combined total number of credits for all courses taken.

- 1) $GP = (SS - 55) / 10$ However, if $GP < 0.5$, $GP = 0.0$.
 SS is the raw score out of 100 possible points.
- 2) $GPA = (\text{Combined total of } [GP \text{ of the course taken} \times \text{No. of credits for that course}]) / \text{Total number of credits for courses taken}$
 The combined total number of credits for courses taken also includes the number of credits for failed courses ($GP = 0$).

(d) Combined use of two GPA indices (f-general GPA and f-strict GPA)

To fully utilize the functional properties of the GPA, and to maintain compatibility with other domestic and overseas universities, the University utilizes both the f-strict GPA and f-general GPA indices (f = functional).

We have verified that f-strict GPA is, in practice, fully compatible with the GPA currently used at many universities. However, in the case of the top grade zone, many universities, particularly in the U.S. and Japan, utilize a maximum GP(A) of 4.0, and a minimum passing GP(A) of 1.0, while f-strict GP(A) utilizes a maximum of 4.5 and a minimum of 0.5. Accordingly, the University has prioritized compatibility with other organizations, and utilizes an f-general GPA in which an f-strict GP of 4.0 or higher (95 points or higher out of 100) is set at a uniform 4.0, and 0.5 to 1.0 is set at a uniform 1.0.

On the other hand, when the GPA is used for a variety of purposes within the University, f-strict GP(A) (which accurately reflects the original grade for the entire grade range) is used.

<Example>

Example of functional GPA calculation

- The method of calculating the GP and the average for 5 courses and 17 credits

Course name	No. of credits	Grade points	LG	f-strict GP	f-strict GP x No. of credits	f-general GP	f-general GP x No. of credits
Introduction to Geography	2	84	A	2.90	5.80	2.90	5.80
Earth Science	2	98	S	4.30	8.60	4.00	8.00
Exercises in Earth Science	4	50	D	0.00	0.00	0.00	0.00
Experiments in Earth Science	1	66	C	1.10	1.10	1.10	1.10
Graduation Research	8	70	B	1.50	12.00	1.50	12.00
Total	17				27.50		26.90

The GP in the fifth and seventh columns is calculated using the following formula. A maximum of 100 grade points is possible, but in some courses values after the decimal point can be used for evaluation.

$$GP = (\text{Grade points} - 55) / 10 \quad (\text{However, if } GP < 0.5, \text{ then } GP = 0.0.)$$

Finally, because $GP = \sum (GP \times \text{No. of credits for the relevant courses}) / \text{Total number of credits taken}$, in the example above we get the following.

$$\text{f-strict GPA} = 27.50 / 17 = 1.617$$

$$\text{f-general GPA} = 26.90 / 17 = 1.582$$

★ Notes

- In terms of scaled evaluation, the values in the example above correspond to the area near the bottom of the favorable zone. Accordingly, it is an example of performance that is not very good overall.
- Because the student in the example above failed Exercises in Earth Science (4 credits for the year), the GP is 0. In addition, the course carried a relatively large number of credits, resulting in a significant loss to the student's GPA. If, for example, the student had earned 80 points in the course, the f-strict GPA would have been 2.205.
- We will also simulate an example of a favorable case in which the student learned well and earned relatively good grades.

Course name	No. of credits	Grade points	LG	f-strict GP	f-strict GP x No. of credits	f-general GP	f-general GP x No. of credits
-------------	----------------	--------------	----	-------------	------------------------------	--------------	-------------------------------

Introduction to Geography	2	84	A	2.90	5.80	2.90	5.80
Earth Science	2	98	S	4.30	8.60	4.00	8.30
Exercises in Earth Science	4	80	A	2.50	10.00	2.50	10.00
Experiments in Earth Science	1	90	S	3.50	3.50	3.50	3.50
Graduation Research	8	85	A	3.00	24.00	3.00	24.00
Total	17				51.90		51.60

f-strict GPA = $51.90/17 = 3.052$

f-general GPA = $51.60/17 = 3.035$

In the United States, some non-life insurance companies give benefits to students who maintain a GPA of 3.0 or higher, such as a 25% discount on automobile insurance. It is an indication of an aspect of the social currency possessed by this value.

(e) Courses included in GPA calculation

All courses are included in GPA calculation, except courses taken at other universities (including overseas study) or at the University that are evaluated as transfer credits or utilize a pass/fail system, rather than a letter grade or raw score.

(f) GPA calculation date

GPA is calculated based on the grades that have been finalized by the GPA calculation base date. As a rule, the calculation base date is September 15 for the master's program and March 20 for the doctoral program. The courses calculated in the master's program constitute all courses taken from since the time of enrollment, including courses taken in the first semester, the first quarter, and the second quarter of the applicable academic year. The courses calculated in the doctoral program constitute all courses taken from since the time of enrollment, including courses taken in the second semester, the third quarter, the fourth quarter, and the entire year of the applicable academic year.

(g) Listing on transcripts and report cards

Transcripts and reports cards include both the f-strict GP(A) and the f-general GP(A), as well as an explanation of the purpose.

In addition, an explanation of the GPA calculation method and the number of credits that were not approved are also included, and the consistency between the grades and the GPA is clarified.
